

SAP Commerce Labs Requirement – Labs Configuration

We are looking for the following lab environment, and this is for **SAP Commerce Cloud** training, starting the 3rd week of August.

1. SAP Commerce Cloud (Mandatory)

Looking for SAP Commerce Cloud (2211 LTS or your current supported version) with Backoffice, HAC, OCC APIs, SmartEdit, and Solr. Include a sample storefront and pre-loaded sample data — products, categories, customers, orders, and catalogs — to save setup time during training.

2. SAP Integration Suite / BTP (Mandatory)

Looking for Cloud Integration (CPI) and API Management to support CPI/iFlows, REST integration, OAuth, and SAP Commerce integrations. Include Event Mesh, Integration Advisor, and Open Connectors as optional additions.

3. SAP S/4HANA (Sandbox)

Looking for a sandbox or demo S/4HANA system as an integration endpoint for consuming OData services and reading product/customer data.

4. Access

Looking for login credentials for all participants (or shared training accounts) with full permissions across the above systems. Also request to confirm whether SAP Identity Authentication Service (IAS) is available, since we'll demonstrate OAuth and single sign-on.

We also need set up the free-cost tools in the local machine or VM:

Java JDK (OpenJDK), IntelliJ IDEA Community/Eclipse, Apache Maven, Git + GitHub, Docker Desktop, Minikube/Kind, kubectl, MySQL Community Server, Apache Solr, Apache Tomcat, Postman, Spartacus (open source), plus free-trial Azure and SAP BTP trial accounts.

Confirm availability of the above and share the cost per participant per month and possible arrangement to test the Lab environment once it is ready.
